

NaProTECHNOLOGY® - NEW HOPE FOR INFERTILE COUPLES

Tanzél Picard, FCP

NaProTECHNOLOGY® (NPT) is a major breakthrough in monitoring, treating and maintaining a woman's reproductive and gynecological health. NaProTECHNOLOGY® offers new hope for couples with infertility; it is nearly three times more successful

than IVF, it doesn't result in frozen embryos or early selective abortions. It is inexpensive and uses a step ladder approach to dealing with infertility. This new health science approaches women as whole persons and maintains the dignity of the couple. NPT works cooperatively with the body's natural reproductive cycle. It doesn't suppress the body's reproductive system but instead enhances its function by thoroughly evaluating and treating the underlying problems.

NaProTECHNOLOGY® is provided by physicians who have been specifically trained in the system. It uses the Creighton Model FertilityCare System™ (CrMS) to help diagnose the underlying cause of infertility. Women are taught in the CrMS to record different biological markers such as menstrual and mucus flow. These observations are recorded on a daily basis by a woman in a standardized process.

These recordings show the various hormonal events occurring in her cycle, which allows testing and blood work to be done at the correct part of the cycle to help identify abnormalities in her health. The Creighton Model FertilityCare

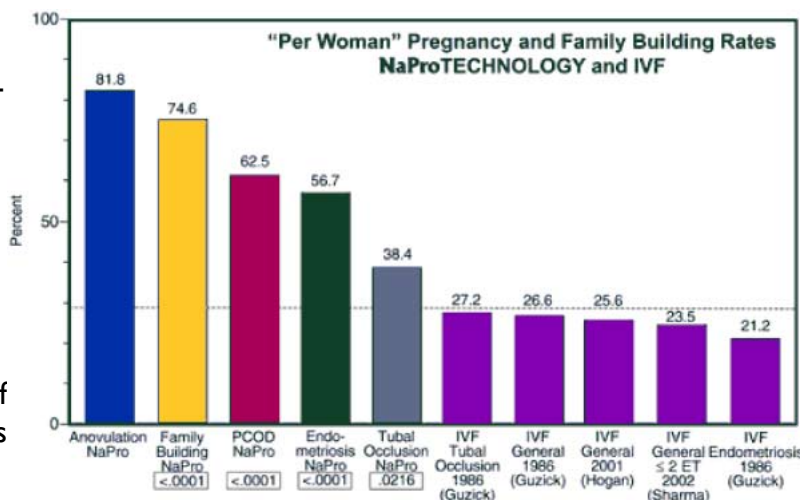

Sytem™ allows a woman to “unravel the mysteries of the menstrual cycle.”¹ By learning to chart her cycle, a woman or couple are put in to the driver's seat and are taught to not only understand how her body works but they are given the opportunity to be a proactive advocate in monitoring and maintaining her gynecological and reproductive health.

A women's CrMS chart can reveal things such as infertility, high risk of miscarriage, low progesterone, abnormal bleeding, and much more.

The effectiveness for achieving pregnancy for couples with infertility with the CrMS chart alone is 20-40% and with the CrMS and NaProTECHNOLOGY® it is

up to 80%.² A study lead by Dr. Phil Boyle in Ireland and published by JABFM in 2008 showed that of couples who had previously been trying for over a year to achieve pregnancy; after completing up to 24 months of treatment with NPT 52.8% had a live birth. Younger couples had a higher success rate and only 4.6% were twin births.³
